

Stainless Steel Accessories

FUEL TANK SKIRT BRACKETS

INSTALLATION INSTRUCTIONS

1. Do not remove plastic coating until the last step, to prevent scratches.
2. Assemble brackets as shown in the diagram below using the supplied hardware. Snug the bolts tight enough so that the brackets require some force to adjust. Do not fully tighten.
3. Unbolt the tank strap bracket nuts and bolt up the 3/16" thick bracket as shown below. Do not tighten fully, this will require adjustment later.
4. Place the tank skirt in the mounting position, with the black trim guard on the flat bracket inside the top angle of the skirt and the bottom angle bracket against the skirts bottom flange.
5. Adjust the brackets to bring the skirt to its desired position, with its top rear flange resting against the protective rubber on the tank strap.
6. Trace the lower mounting bracket holes onto the tank skirt and drill 4, 9/32" holes through the skirt.
7. Re-attach the skirt and push all the brackets to their full extent, so there is no play in the tank skirt. Tighten all mounting bolts.
8. Remove the protective plastic and clean with glass cleaner, if necessary.
